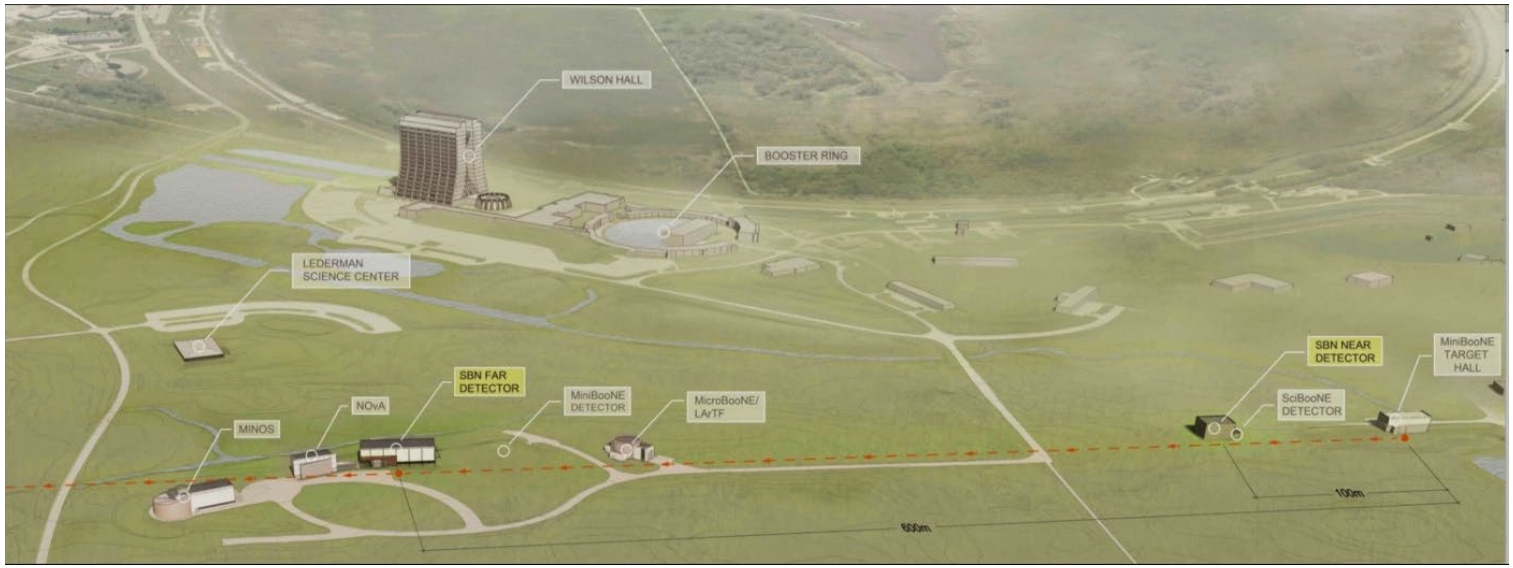
NSF

Fermilab

QuarkNet

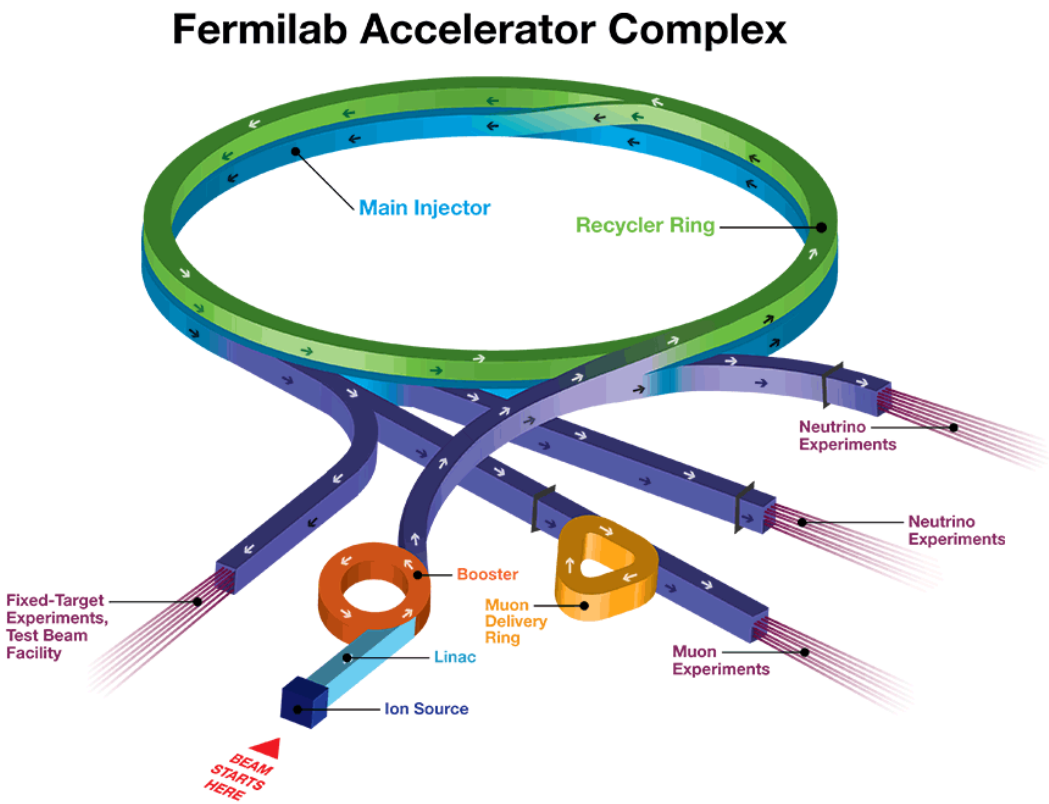
Fermilab



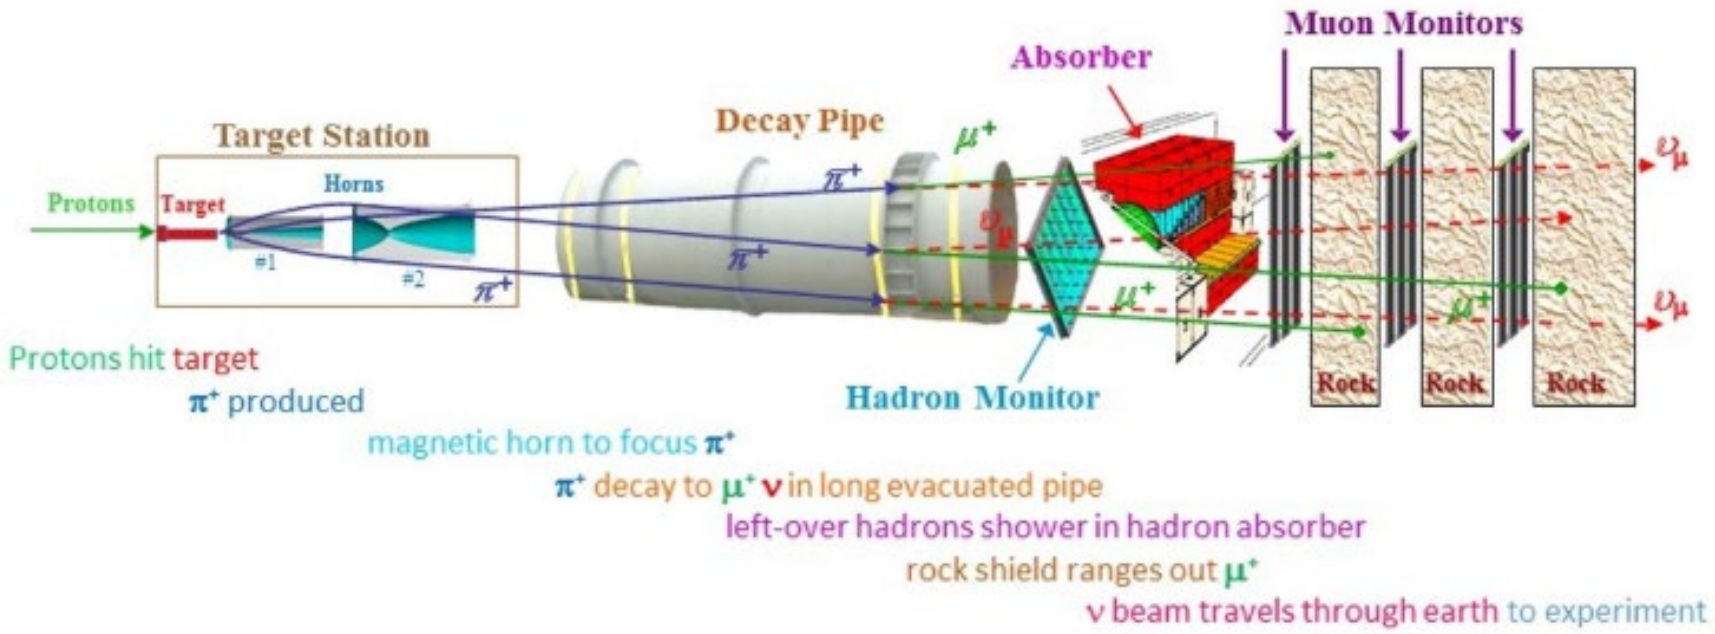
The Fermi National Accelerator Laboratory (Femilab) is the place to be to study neutrinos. The short- and long-baseline programs investigate all sorts of neutrino behaviors and shed light on the nature of the universe.

Fermilab

The Fermilab Main Injector sends protons to a targets for different purposes. Some are sent to create neutrino beams.

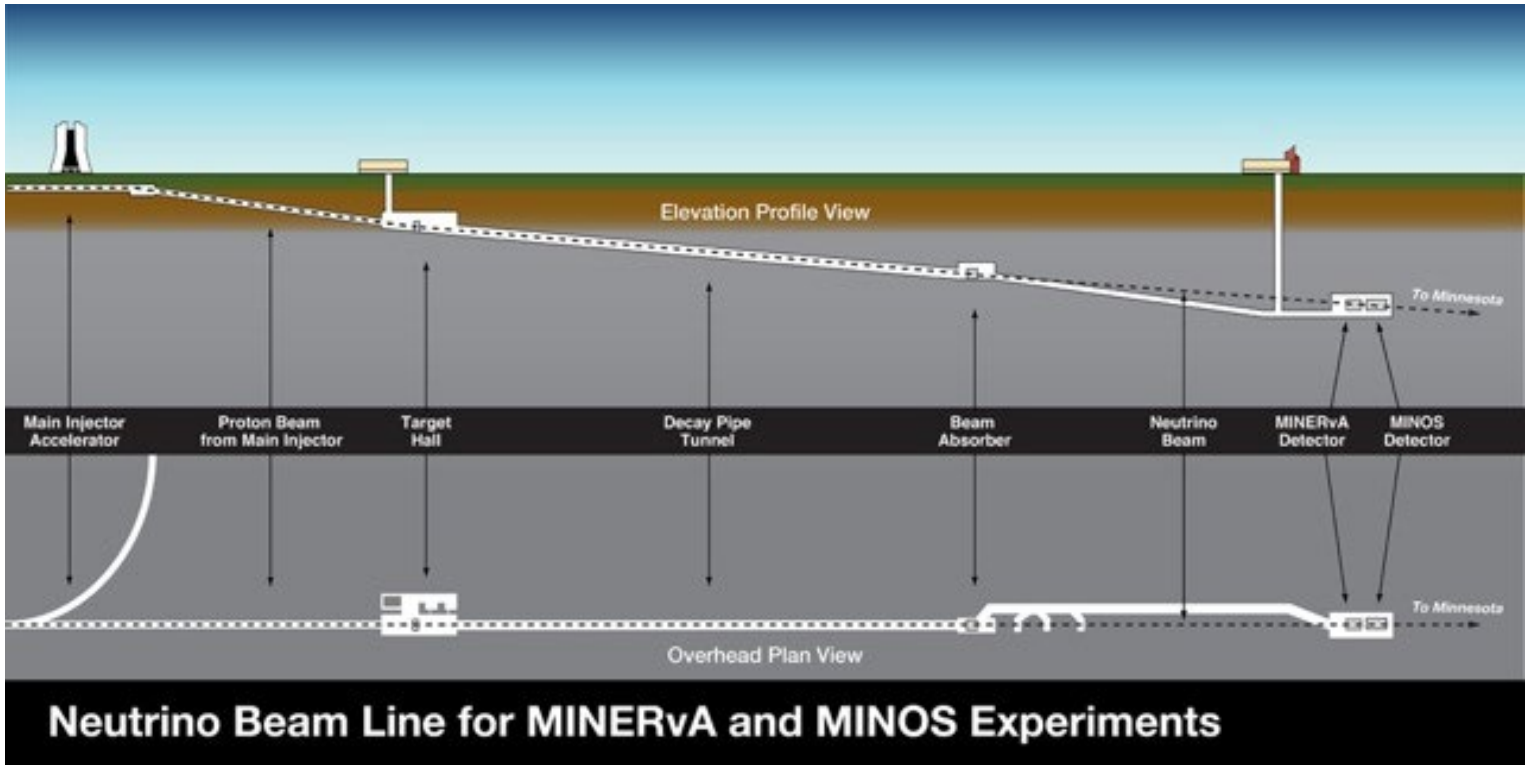


MINOS and MINERvA



protons → target → pions → muons + neutrinos → neutrino beam

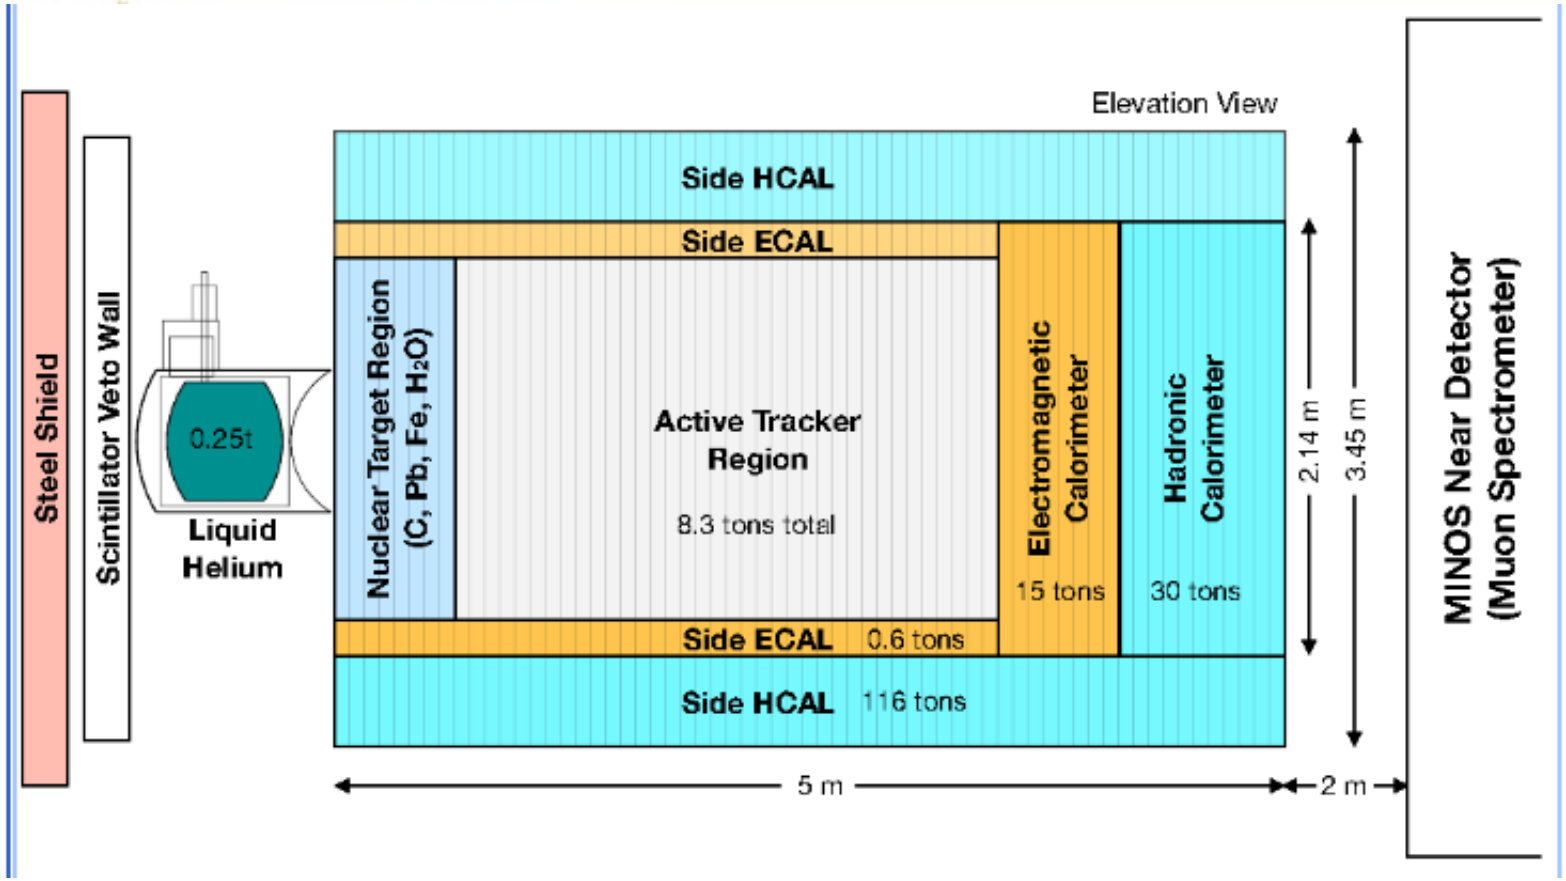
MINOS and MINERvA



Neutrinos for MINOS were measured once at Fermilab and again in a lab in Minnesota; that experiment is ended. MINERvA continues.

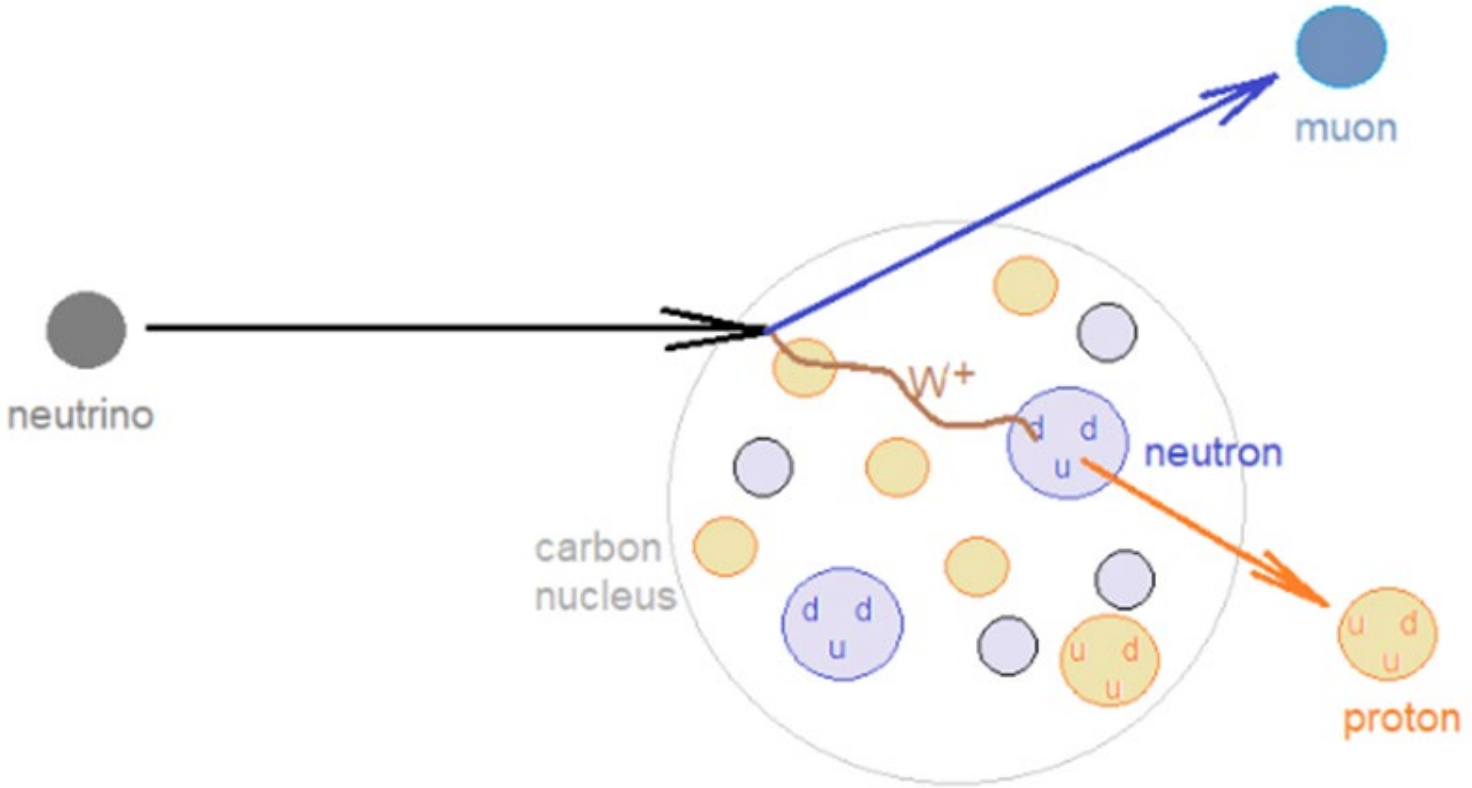
QuarkNet

MINERvA



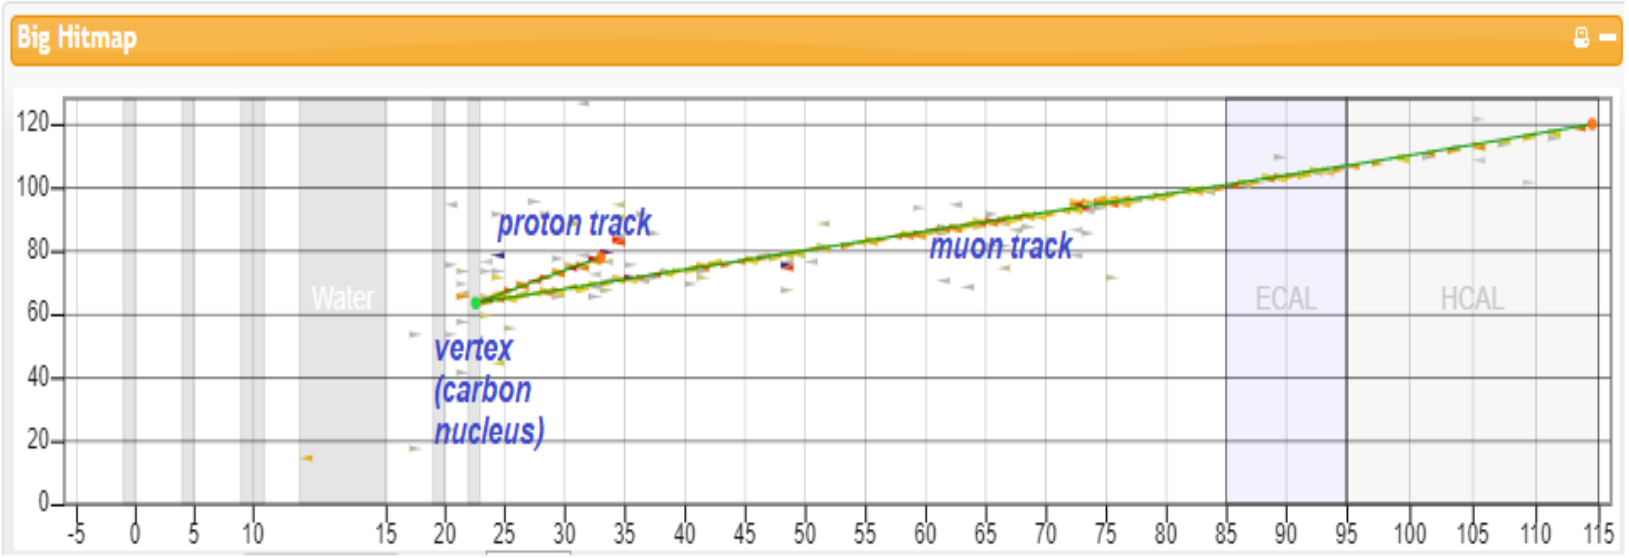
Muon neutrinos hit the carbon target. MINERvA measures the products of the interaction.

The Interaction



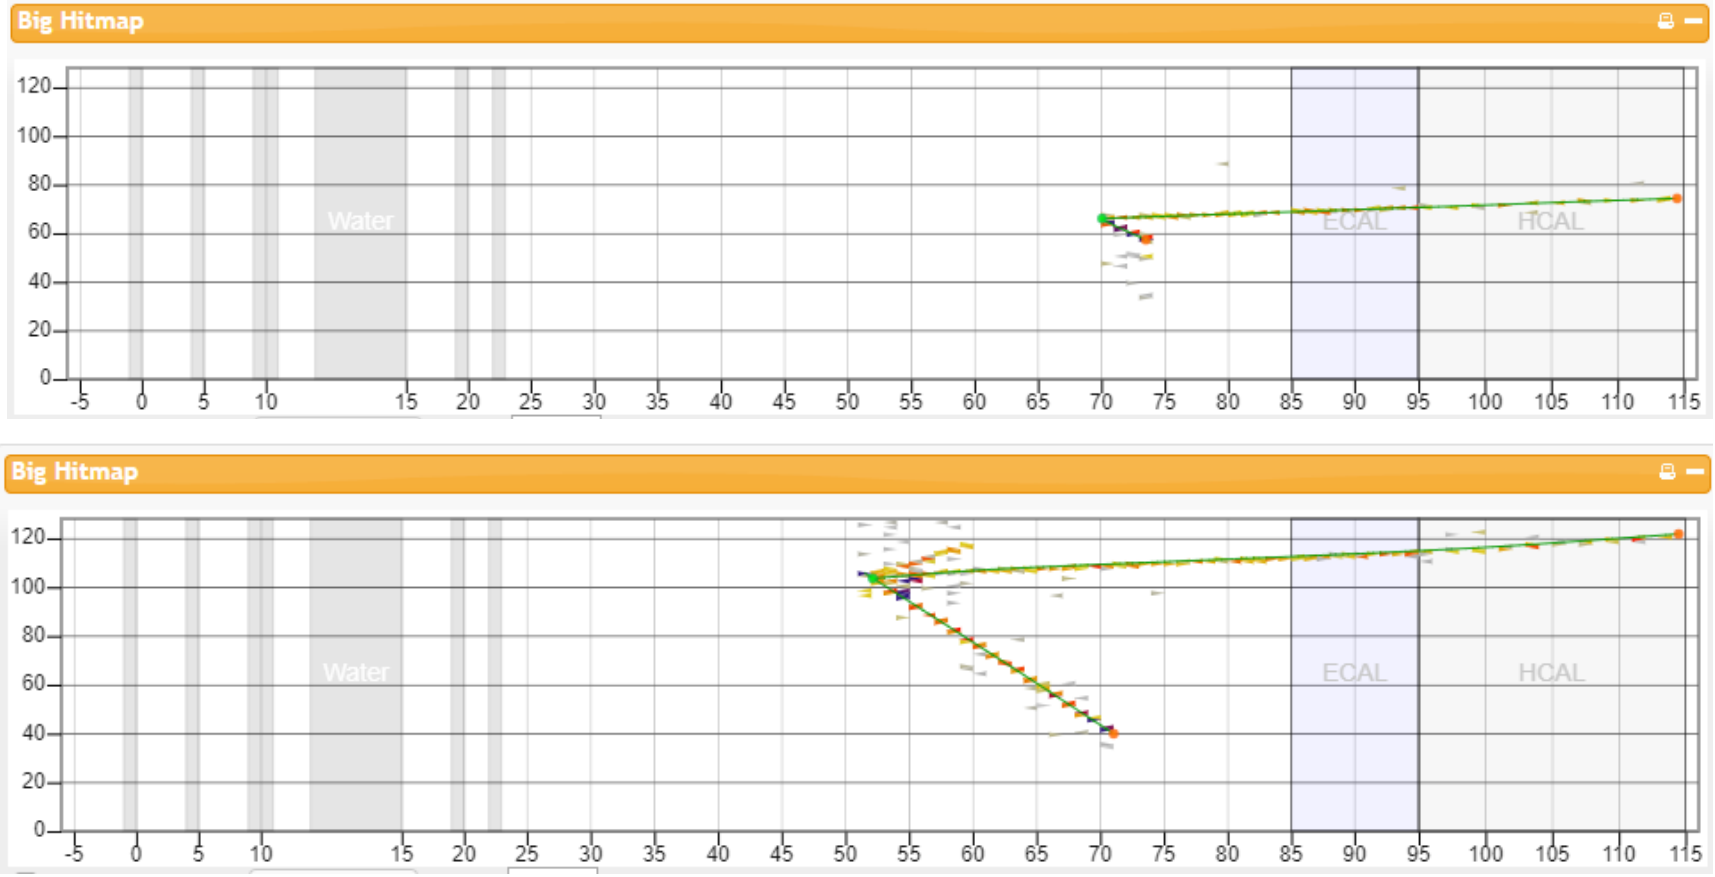
A muon neutrino interacts with a carbon nucleus. A muon and a proton are ejected from the nucleus carrying the neutrino momentum.

Measurement



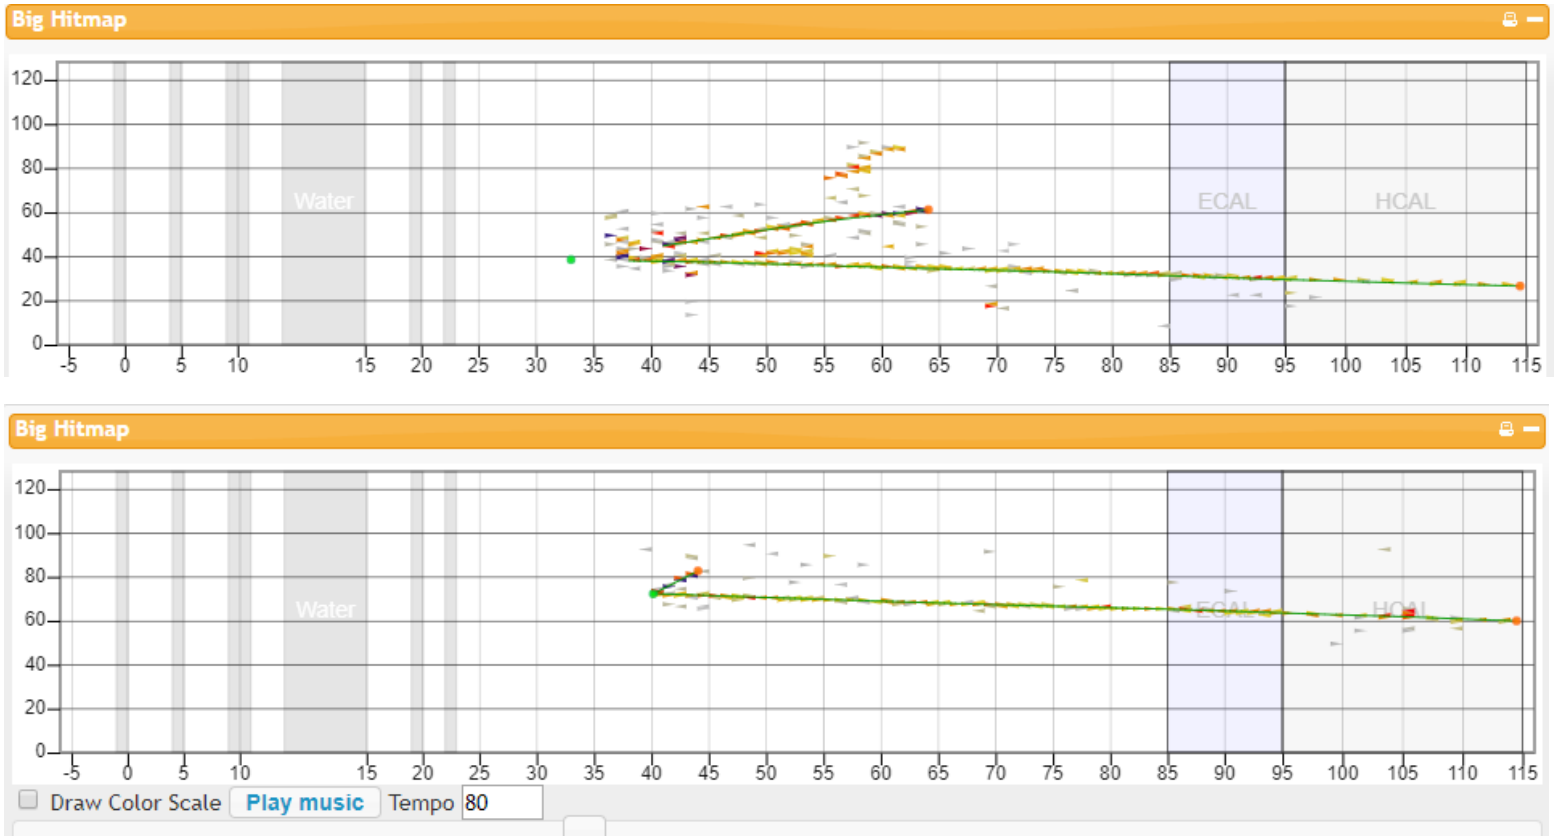
This is what MINERvA “sees”. The neutrino comes from the left, undetected. It hits a carbon nucleus and interacts with a neutron. The interaction transforms the neutrino into a muon and the neutron into a proton. MINERvA can measure the momentum of each.

Signal vs. Background



One of these is signal, one is background. Which is which? Why?

Signal vs. Background

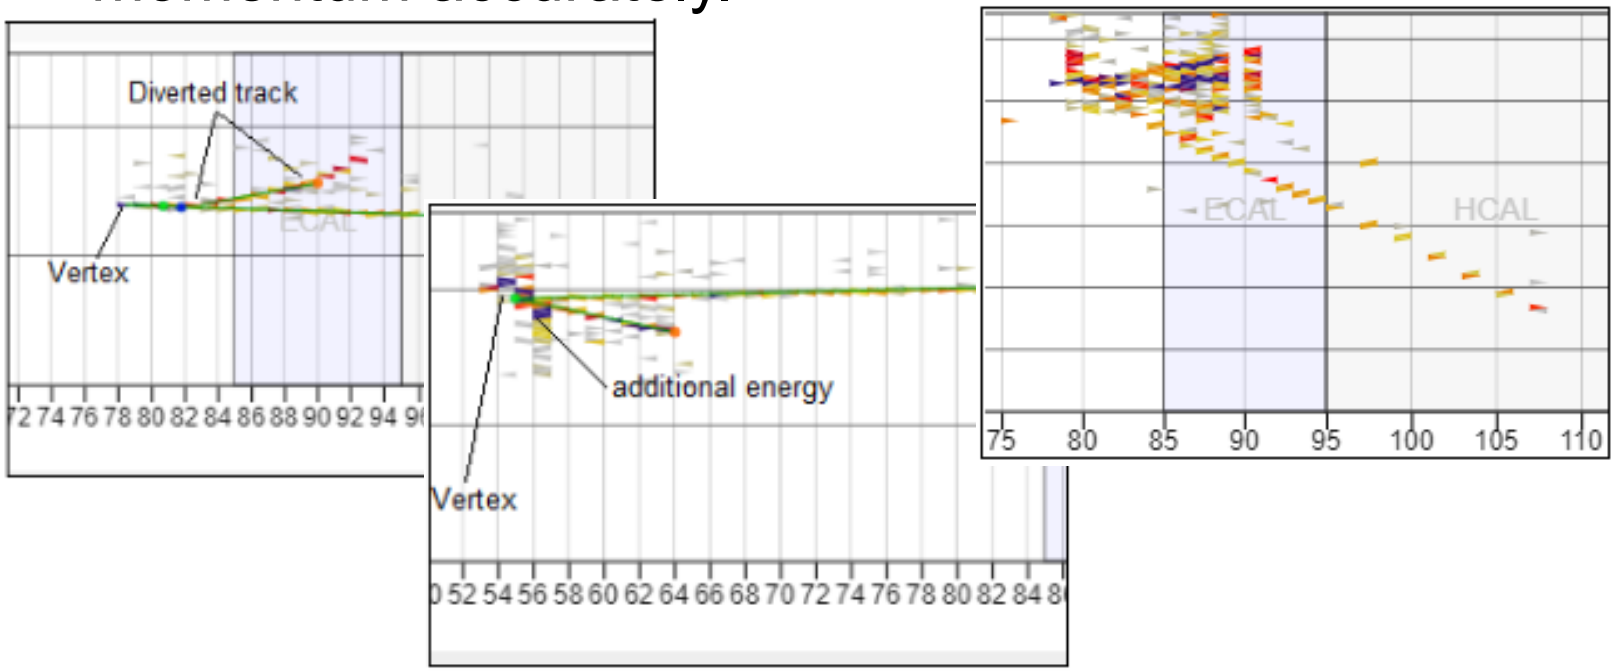


One of these is signal, one is background. Which is which? Why?

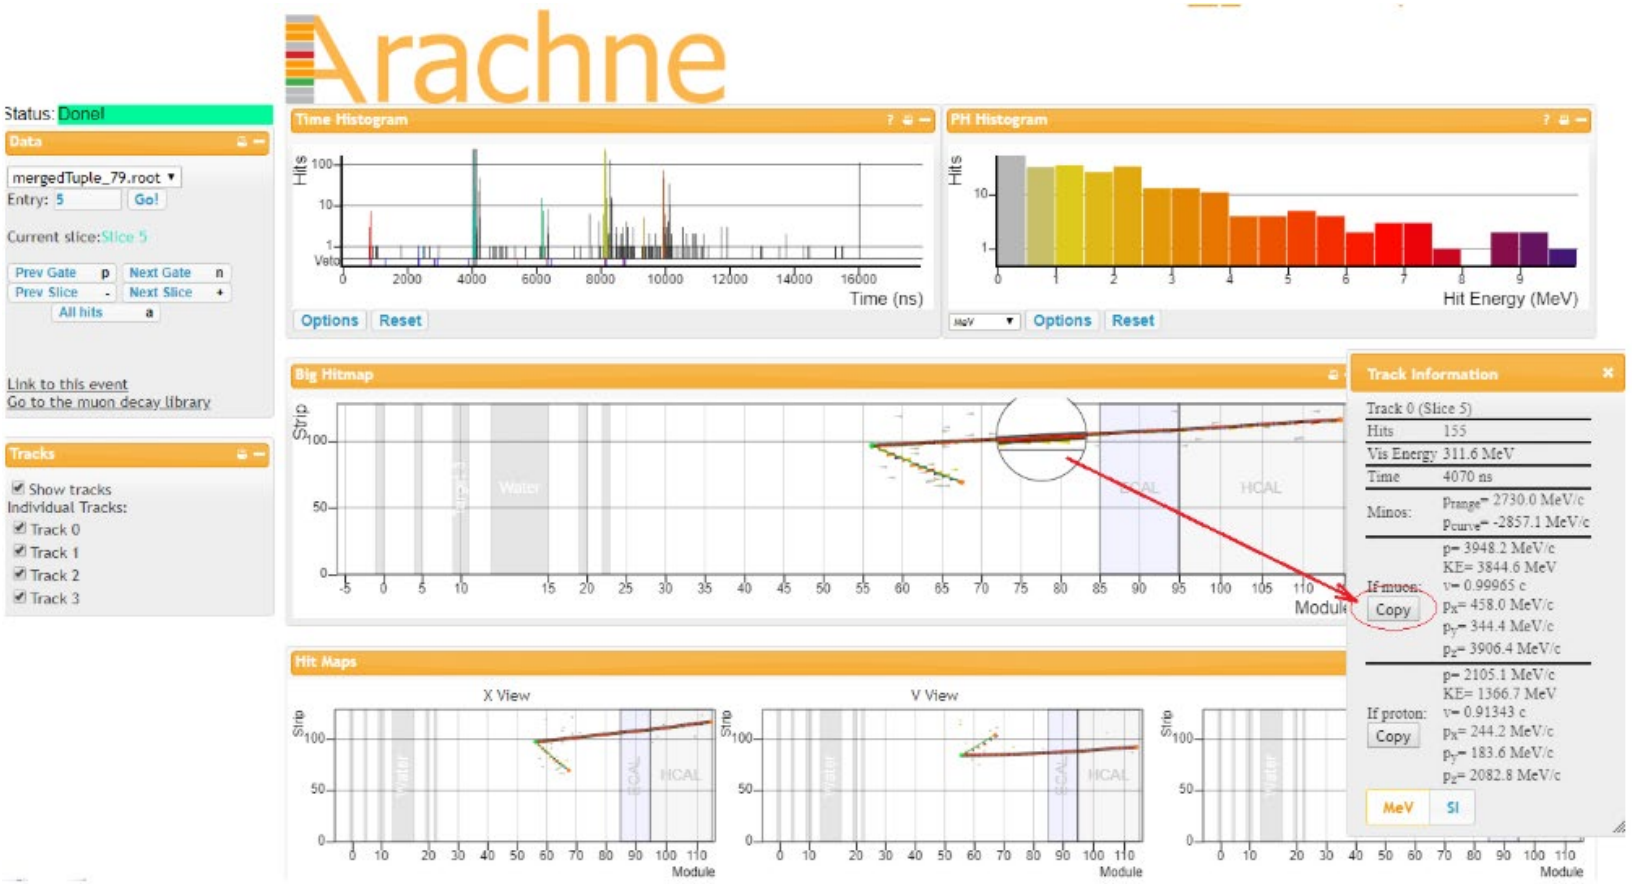
Signal vs. Background

Background events:

- Do not fit signal paradigm of one short proton track, one long muon track, or
- Confound the ability of MINERvA to measure momentum accurately.



Measure signal in Arachne



Transfer to spreadsheet

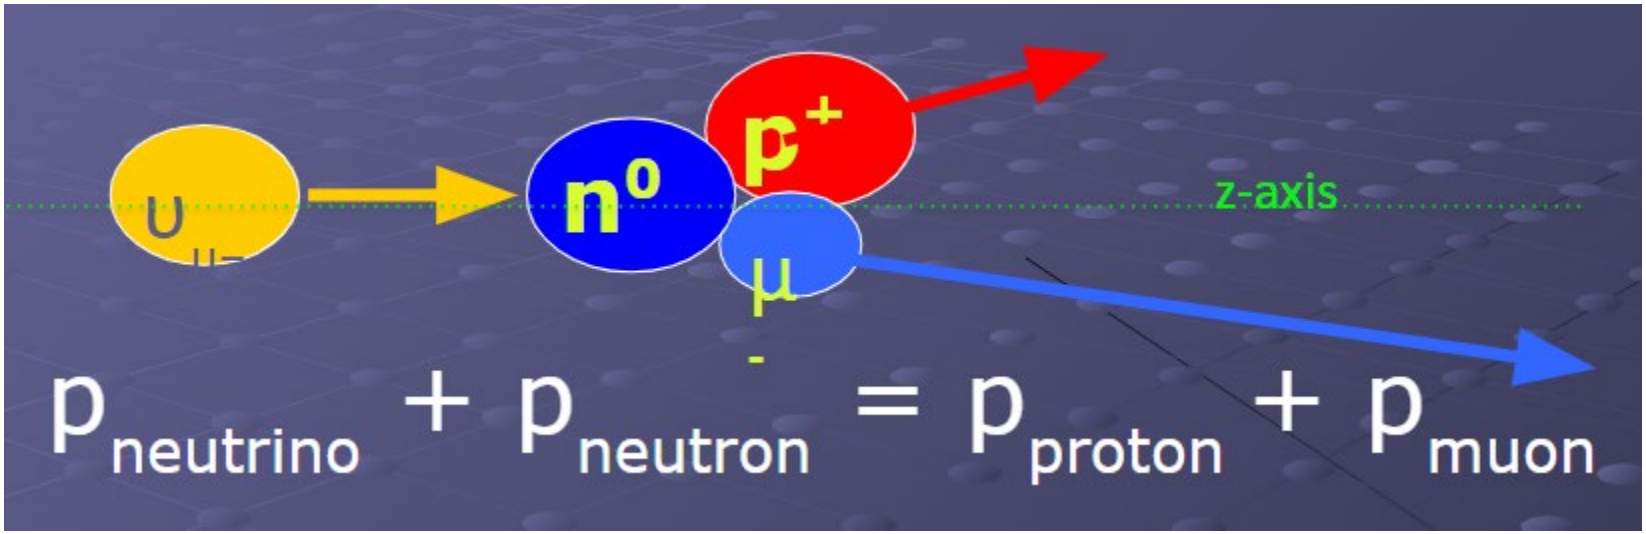
What do we know?

Conservation of momentum:

- Initial momentum p_ν all in z (beam) direction
- Final momentum $p_z = p_{zp} + p_{z\mu}$, $p_x = p_{xp} + p_{x\mu}$, and $p_y = p_{yp} + p_{y\mu}$
- If we measure final p_x , p_y , and p_z what do we get? Why? What does it imply?
- *That is what we are investigating!*



Keep in Mind . . .

"Science is nothing but developed perception, interpreted intent, common sense rounded out and minutely articulated." *George Santayana*

- Indirect observations and imaginative, critical, logical thinking can lead to reliable and valid inferences.

- Therefore: work together, think (sometimes outside the box), and be critical of each other's results to figure out what is happening.

Let's Analyze Events!

Make teams of two.

Practice.

Talk with physicists.

Find good $\nu^0 \rightarrow p^+ + \mu^-$ candidates.

Which events go to the spreadsheet?

Let's plot final p_x, p_y, and p_z.

Let's see what they mean!

Report! Rapport! Rejoice! Relax!
